(57) ABSTRACT

An artificial fishing lure which has a pair of interconnected tumblers. The tumblers are to rotate when the fishing lure is moved through water which is to be an attractant to a fish to induce striking of the lure. By the interconnecting of the tumblers, the tumblers are always rotated at the same speed but in opposite directions thereby balancing the movement of the tumblers on the lure assuring that the lure always moves in an upright position through the water and does not turn over which would twist the fishing line to which the lure is attached.
