ASSIGNMENT OF INTELLECTUAL PROPERTY SECURITY AGREEMENT

This ASSIGNMENT OF INTELLECTUAL PROPERTY SECURITY AGREEMENT (this "Assignment"), dated as of November 17, 2015, is by GENERAL ELECTRIC CAPITAL CORPORATION, (as the current and resigning administrative agent, the "Retiring Agent") and HEALTHCARE FINANCIAL SOLUTIONS, LLC¹, (as the successor administrative agent together with its successors and assigns, the "Successor Agent").

RECITALS:

WHEREAS, Symmetry Surgical, Inc., Specialty Surgical Instrumentation, Inc., Olsen Medical, Inc., Symmetry Medical SSI Real Estate, LLC, Symmetry Surgical International, Inc., as "Grantor", and Retiring Agent are parties to one or more intellectual property security agreements identified in Exhibit A attached hereto (as the same have been and may hereafter be amended, restated, supplemented or otherwise modified from time to time, collectively, the "Agreements") pursuant to which Grantor granted a security interest in and to and lien upon the intellectual property identified in Exhibit B (the "Subject IP"); and

WHEREAS, pursuant to that certain Omnibus Agency Transfer Agreement by and between Retiring Agent and Successor Agent, Retiring Agent has assigned to Successor Agent all of its rights, remedies, duties and other obligations under, among other documents, the Agreements and the Subject IP, in each instance, in its capacity as administrative agent and collateral agent, as the case may be.

NOW, THEREFORE, in consideration of the foregoing, and for other good and valuable consideration, the receipt and sufficiency of which is hereby acknowledged, Retiring Agent herby assigns and transfers to Successor Agent and its successors and assigns, all of its rights, title and interest in and to the Agreements.

This Assignment may be executed in any number of counterparts, each of which when so executed shall be deemed an original and all of which taken together shall constitute one and the same instrument.

- Remainder of Page Intentionally Left Blank; Signature Page Follows –

¹ Healthcare Financial Solutions, LLC is a Delaware limited liability company that does business as HFS Healthcare Financial Solutions, LLC in Alabama, California, Florida, Illinois, Maryland, Missouri, New Jersey, New Mexico and Texas and as HFS Healthcare Financial Solutions in New Hampshire

IN WITNESS WHEREOF, Retiring Agent and Successor Agent have caused this Assignment to be duly executed as of the date first above written.

RETIRING AGENT:

GENERAL ELECTRIC CAPITAL CORPORATION As Retiring Agent

EXHIBIT A

Trademark Security Agreement dated as of December 5, 2014 and filed with the United States Patent and Trademark Office on December 8, 2014 at Reel 5414, Frame 0224.

Patent Security Agreement dated as of December 5, 2014 and filed with the United States Patent and Trademark Office on December 12, 2014 at Reel 034485, Frame 0011.

Patent Security Agreement dated as of August 28, 2015 and filed with the United States Patent and Trademark Office on August 28, 2015 at Reel 036452, Frame 0011.

Assignment of Intellectual Property Security Agreement

EXHIBIT B

[See attached]

Assignment of Intellectual Property Security Agreement

SCHEDULE I TO PATENT SECURITY AGREEMENT

Patent Registrations

1. REGISTERED PATENTS

Hemostatic Clip Cartridge

No. 8,042,687

Filed June 10, 2008

Application No. 12/136,593

Hemostatic clip cartridge having a plurality of individual compartments for holding preformed hemostatic clips. Each individual compartment progressively increases in width from the centerline of the cartridge. Flexible retaining fingers extend into each individual compartment and secure the hemostatic clip to a pedestal. Harvesting the hemostatic clip from that particular individual compartment by a clip applicator moves at least one of the retaining fingers from a first position to a post-harvest position. Subsequent removal of the clip applicator with the harvested hemostatic clip from that particular individual compartment leaves at least one of the retaining fingers in the post-harvest position different from the first position so that the post-harvest position of the at least one of the retaining fingers indicates that the particular individual compartment has been accessed by the clip applicator.

		A rongeur has an elongated					
		shank having a distal end and a proximal end. An elongated					
		crossbar, which moves between					
		a retracted position and a tissue					
		capturing position position, has a					
		distal end and a proximal end					
		and reciprocates axially with					
		respect to the shank. A first tip is					
		selectively connected to the					
		shank. The first tip has a					
		proximal end and a distal end.					
		The proximal end has a reduced					
		diameter post. In the selectively connected position, the reduced					
		diameter post of the first tip is					
		received in a bore of the shank.					
		A second tip is selectively					
		connected to the crossbar. The					
		second tip has a proximal end					
	Ronge	and a distal end. The proximal					
	ur	end has a reduced diameter post.					
	with	In the selectively connected

	bly with contro lled rotatio n	retractor blade includes a blade portion and a handle portion which may be integrally joined or may fit together in a modular way to allow different blades to be removably and interchangeably affixed to the handle assembly. A dovetail may mount the blade in a plane substantially transverse or perpendicular to the shaft. The shaft translates within a multiposition locking mechanism to allow adjustment of the handle extension along one or more axes, while the in-plane swing of the blade about the shaft conveniently positions the tip of the blade under tissue to be retracted when bone or hard tissue impedes access along the retraction direction parallel to the axis of the shaft. The retractor handle has a regular cross-section with one or more protruding lobes or ridges extending along the axial direction such that the edge-to-edge diameter of the handle varies with angular position about the axis, and peaks at one or more lobes or opposed pairs of lobes so that the ridges jam by interference against the walls of a channel in a clamping assembly. Preferably the blade is formed of a radiolucent polymer and may have its surface dished or curved in one or more directions, or may have a lip or flare adapted for contacting or retracting a particular tissue or structure. 		member. The rotating				
		indexer is mated to the				
		housing member, and the				
		housing member is rotatable				
		with respect to the rotating				
		indexer so that the retractor				
		blade holder, the housing				
		member and the retractor				
		blade are able to selectively				
		rotate about the longitudinal				
		axis of the rotating indexer.				
		The rotating indexer is				
		shaped and dimensioned to				
		mount onto a rim of a				
		surgical support. The self-				
		retaining locking				
		mechanism simultaneously				
		locks or unlocks the position				
		of the housing member				
		relative to the rotating				
1		indexer and the position of				
1		the rotating indexer and the				
		entire ratchet assembly onto				
		the rim of the surgical				
		support.				
		provides a linear slide				
		indicator used in connection				
		with a medical device to				
		indicate radial expansion or				
		linear translation of a				
		component within the				
		device. The medical				
		instrument includes a shaft,				
		a handle, an end effector				
		and a linear slide indicator.				
		The shaft extends along a				
		shaft axis and is configured				
		to travel linearly along the				
		shaft axis. The handle is				
		configured to be attached to				
		a proximal end of the shaft				
		and to rotate around the				
		shaft axis. The end effector				
1		is configured to be attached				
		to a distal end of the shaft				
1		and to travel linearly with				
		the shaft along the shaft axis				
		via the rotational motion of				
		the handle. The linear slide
