Abstract: This paper presents a new approach to the problem of finding a good representation for a set of data. The approach is based on the idea of using a set of basis functions to represent the data. The basis functions are chosen such that they are linearly independent and span the space of the data. The data is then represented as a linear combination of these basis functions. This approach is shown to be effective for a variety of data sets, including those with complex, non-linear relationships. The results are compared to those of other methods, and the advantages of this approach are discussed.
